## Customer Intelligence & RFM Segmentation Report

### Executive Summary

This project analyzes customer behavior using RFM segmentation to identify high-value customers and churn risk segments. The analysis reveals that champion customers drive the majority of revenue, while a meaningful portion of the customer base shows signs of disengagement. The dashboard supports data-driven retention and growth strategies.

### Data Overview

The dataset includes customer profiles, product inventory, and over 5,000 sales transactions across multiple regions and product categories. The analysis focuses on customer-level aggregation to ensure accurate segmentation.

### Analytical Approach

RFM methodology was applied to evaluate customer value:

- **Recency:** Time since last purchase
- **Frequency:** Number of transactions
- **Monetary:** Total customer spend

Customers were segmented into Champion, Active, and At-Risk groups. SQL was used for aggregation and segmentation, and Power BI was used for visualization.

### Key Insights

- Champion customers represent the primary revenue drivers.
- Revenue is concentrated in specific product categories and geographic regions.
- At-risk customers represent a measurable churn risk.
- Active customers present conversion opportunities.

## Strategic Recommendations

- Strengthen loyalty initiatives for champion customers.
- Deploy targeted re-engagement campaigns for at-risk segments.
- Convert active customers through personalized offers.
- Optimize marketing investment toward high-performing categories and regions.

## Conclusion

The dashboard delivers actionable customer intelligence that enables targeted retention strategies and revenue optimization. The segmentation framework can be extended for ongoing performance monitoring.
